Report of *Anaxipa exigua* (Orth.: Trigonidiidae) from Iran

M. Mofidi-Neyestanak

Re-examining of the ensiferous Orthoptera in the Hayk Mirzayans Insect Museum (HMIM) of Plant Pests and Diseases Research Institute (PPDRI), a Gryllid was identified as *Anaxipa exigua* (Say, 1825). Similar to other members of this family, it has three pairs of long movable spines along the post tibiae and two long inner and three short outer spurs at the tip; second segment of the tarsi is flattened and the ovipositor is short and slightly curved up.

It differs from *Trigonidium ecaudatodes* Rambur, the other member of the family already reported from Iran, mainly by having stridulatory organ on the male tegmina and tympanal organ on the foretibiae.

Locality citation: South of Iran, Hormozgan province: Issin, 130 m. alt.; Genu Mt., 410 m. alt., 1977 by Pazuki and Hashemi.
